Método maestro

Permite resolver recurrencias de la forma:

$$T(n) = aT(n/b) + f(n)$$
, donde $a \ge 1$, $b > 1$

Dado T(n) = aT(n/b) + f(n), donde $a \ge 1$, b > 1, se puede acotar asintóticamente como sigue:

1.
$$T(n) = \Theta(n^{\log_b a})$$

Si $f(n) = O(n^{\log_b a - \varepsilon})$ para algún $\varepsilon > 0$

2.
$$T(n) = \Theta(n^{\log_b a} \lg n)$$

Si $f(n) = \Theta(n^{\log_b a})$ para algún $\varepsilon > 0$

3.
$$T(n) = \Theta(f(n))$$

Si $f(n) = \Omega(n^{\log_b a + \varepsilon})$ para algén>0 si a*f(n/b)
 $\leq c*f(n)$

para alaun c<1

Dado
$$T(n) = 9T(n/3) + n$$

$$n^{\log_3 9} = n^2$$
 Vs $f(n) = n$

Es
$$f(n)=O(n^{\log_b a-\epsilon})$$
 ?
Es $n=O(n^{2-\epsilon})$?

Dado
$$T(n) = 9T(n/3) + n$$

$$n^{\log_3 9} = n^2 \mathbf{v_s} \qquad f(n) = n$$

Es
$$f(n)=O(n^{\log_b a-\epsilon})$$
 ?
Es $n=O(n^{2-\epsilon})$?
Si $\epsilon=1$ se cumple que $O(n)$, por lo tanto, se cumple que:

$$T(n) = \Theta(n^2)$$

$$T(n) = T(2n/3) + 1$$

$$n^{\log_{3/2} 1} = n^0 = 1$$
 v_s $f(n) = 1$

Es
$$f(n)=O(n^{\log_b a-\varepsilon})$$
 ?
Es $1=O(n^{0-\varepsilon})$?

No existe $\varepsilon > 0$

$$T(n) = T(2n/3) + 1$$

$$n^{\log_{3/2} 1} = n^0 = 1$$
 vs $f(n) = 1$

Es
$$f(n) = \Theta(n^{\log_b a})$$
 ?
Es $1 = \Theta(1)$?

Si, por lo tanto, se cumple que:

$$T(n) = \Theta(1*\lg n) = \Theta(\lg n)$$

$$T(n) = 3 T(n/4) + nlgn$$

$$n^{\log_4 3} = n^{0.793} \quad \text{vs} \quad f(n) = n | \text{gn}$$
Es $f(n) = O(n^{\log_b a - \epsilon})$?
Es $f(n) = \Theta(n^{\log_b a})$?
Es $f(n) = \Omega(n^{\log_b a + \epsilon})$?
Si, y además, af(n/b) \le cf(n)
$$3(n/4) | g(n/4) \leq \text{cnlgn}$$

T(n) = 2T(n/2) + nlgn

Muestre que no se puede resolver por el método maestro

Resuelva usando método del maestro

$$T(n) = 4T(n/2) + n$$

$$T(n) = 4T(n/2) + n^2$$

$$T(n) = 4T(n/2) + n^3$$

Método de sustitución

Suponer la forma de la solución y probar por inducción matemática

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Suponer que la solución es de la forma T(n)=O(nlgn)

Probar que T(n)≤cnlgn.

Se supone que se cumple para n/2 y se prueba para n

Hipotesis inductiva: $T(n/2) \le cn/2lg(n/2)$

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Hipótesis inductiva: $T(n/2) \le cn/2lg(n/2)$

Paso inductivo:

```
T(n) \le 2(cn/2lg (n/2)) + n

\le cn lg (n/2) + n

= cn lg (n) - cn + n, para c \ge 1, haga c = 1

\le cn lg n
```

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Paso base: si c=1, probar que T(1)=1 se cumple

$$T(1) \le 1*1 lg 1?$$

1 \le 0?

No, se debe escoger otro valor para c

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Paso base: si c=2, probar que T(1)=1 se cumple

$$T(1) \le 2*1 lg 1?$$

1 \le 0?

No, se puede variar k.

Para esto, se calcula T(2) y se toma como valor inicial

Probar que T(n)≤cnlgn.

$$T(2)=2T(0)+2=4$$

Paso base: si c=1, probar que T(2)=4 se cumple

$$T(2) \le 1*2lg 2 ?$$

$$4 \leq 2$$
?

No, se puede variar c.

Probar que T(n)≤cnlgn.

$$T(2)=2T(0)+2=4$$

Paso base: si c=3, probar que T(2)=4 se cumple

$$T(2) \le 3*2lg 2 ?$$

Si, se termina la demostración

$$T(n)=T(n-1)+T(n-2)+1$$
, $T(1)=O(1)$, $T(2)=O(1)$

Suponer que la solución es de la forma $T(n)=O(2^n)$

Probar que $T(n) \le c2^n$.

Se supone que se cumple para n-1 y se n-2 prueba para n

Hipotesis inductiva: $T(n-1) \le c2^{(n-1)}$ y $T(n-2) \le c2^{(n-2)}$

$$T(n)=T(n-1)+T(n-2)+1$$
, $T(1)=O(1)$, $T(2)=O(1)$

Ahora se debe probar que: $T(n) \le c2^n$

$$T(1) \le c2^1 \rightarrow 1 \le 2^*c$$

$$T(2) \le c2^2 \rightarrow 1 \le 4*c$$

$$T(3) \le c2^3 \rightarrow 2 \le 8*c$$

$$T(4) \le c2^4 \rightarrow 3 \le 16*c$$

$$T(5) \le c2^5 \rightarrow 5 \le 32*c$$

$$T(6) \le c2^6 \to 8 \le 64*c$$

$$T(7) \le c2^7 \rightarrow 13 \le 128*c$$

$$T(8) \le c2^8 \rightarrow 21 \le 256 * c$$

Con c = 1, se cumple.
